

Conclusion

The **Credit Card Approval Prediction** project was successfully developed to predict whether a credit card application is likely to be approved or rejected using machine learning techniques. The system analyzes important applicant details such as gender, age, annual income, occupation, education, family status, housing type, employment years, and other relevant information to make accurate predictions.

The project follows a complete machine learning workflow, including data collection, data preprocessing, feature engineering, model training, model evaluation, and deployment through a Flask-based web application. A user-friendly interface was developed using HTML and CSS, allowing users to enter applicant details and receive instant prediction results.

This project demonstrates the practical application of Python, Machine Learning, Flask, HTML, CSS, and GitHub in solving a real-world banking problem. It helps reduce manual effort, improves decision-making, and provides faster and more reliable credit card approval predictions.

Overall, the project enhances knowledge of machine learning, web application development, and data analysis while offering an efficient and effective solution for credit card approval prediction.
